The wireless card does not work as a result Bendy and the ink machine chapter 3 free download.. Windows version 1709 seems to be the only build impacted by this issue I reported this via Windows Insider Feedback Hub weeks before the release of 1709 when I experienced the issue on an Insider build.. As keetrock46270 stated earlier in this thread, the problem is well documented here: I feel this is an accurate summary of the issue: - This issue impacts those with a PCE-AC68 wireless card AND an AMD CPU who have upgraded to Windows 10 Fall Creators (version 1709).. Apparently the 88 driver has a problem with how Windows/driver implemented atomic operations.

- Some with Intel CPUs have reported problems as well, but this is likely a separate issue/root cause.. Insane isnt it! I tried everything possible for 3 days My brother came over and i asked him what he though.. He was a computer technician 14 years ago Been out of the game along time but he said right out off the bat that i bet the problem is reassignment of resources and you need to find a way to lock your devices to the slot.. Unlocking and then rebooting brought it back So there are definite differences between the 88 and 68 in terms of how they behave as Windows manipulates the registers on the PCI bus -- or as whatever device driver Windows is using does this.. - The latest ASUS driver (Version 2 1 4 3) and card work fine with Windows 10 Insider Preview Build 17025 and later. The same error appears in Device Manager Can anyone provide some additional detail? Are you using local or MS accounts? Was the driver installed before making the adjustment via msconfig or after? Did you install the latest driver or an earlier version? Did you install using the executable or by searching from within Device Manager for a local file? Did you run msconfig as Admin or as a user with admin privileges? Any additional feedback appreciated.. 1/10 32-bit and 64-bit versions - The latest ASUS driver (Version 2 1 4 3) and card work fine with Windows 10 Creators (version 1703).. Be careful with this I couldn't wait and replaced the 68 with an 88 unit When I locked the pci bus as a test, the 88 went incommunicado on the next boot; that was the only observed failure. - To be clear, this issue is an error Code 10 in Device Manager following driver installation.. It has been documented and reported extensively to both Microsoft and ASUS The common thread seems to be AMD CPUs and the Broadcom 4360 chipset on the PCE-AC68.. Thank you for the fix -- will try it out when I build my next Windows box I tried this suggested fix with a clean install of Windows 10 Fall Creators and it did not work.. I emailed ASUS to inform them as well They thanked me for the

info Im still shocked that my brother knew what to do based on logic from over a decade ago.. He knew it involves msconfig so we started toying with it Found the pci lock and viola! I was blown away.. I say this because users of a similar TP-Link wireless card with the same chipset have experienced the same issue. e828bfe731 [Dvd Label Maker Software For Mac](#)
